Cancellation gaps create a race against the clock

Staff currently check a spreadsheet, match suitable clients, and manage replies by text while an open appointment may remain unfilled.

The first useful solution must

Offer one slot to one eligible client at a time

Keep the oldest eligible client first

Show failures and resume without losing progress

SAME-DAY RESPONSE WINDOW

15 minutes

ACTIVE OFFERS PER OPENING

One

FAIRNESS RULE

Oldest eligible client first

Customer summary supplied by the user. Direct written confirmation from Lena remains unrecorded.

PROTOTYPE BEHAVIOR

One durable process coordinates each cancellation opening

01 **Match**

Filter by service, stylist, and availability. Order by waitlist join time.

02 **Offer**

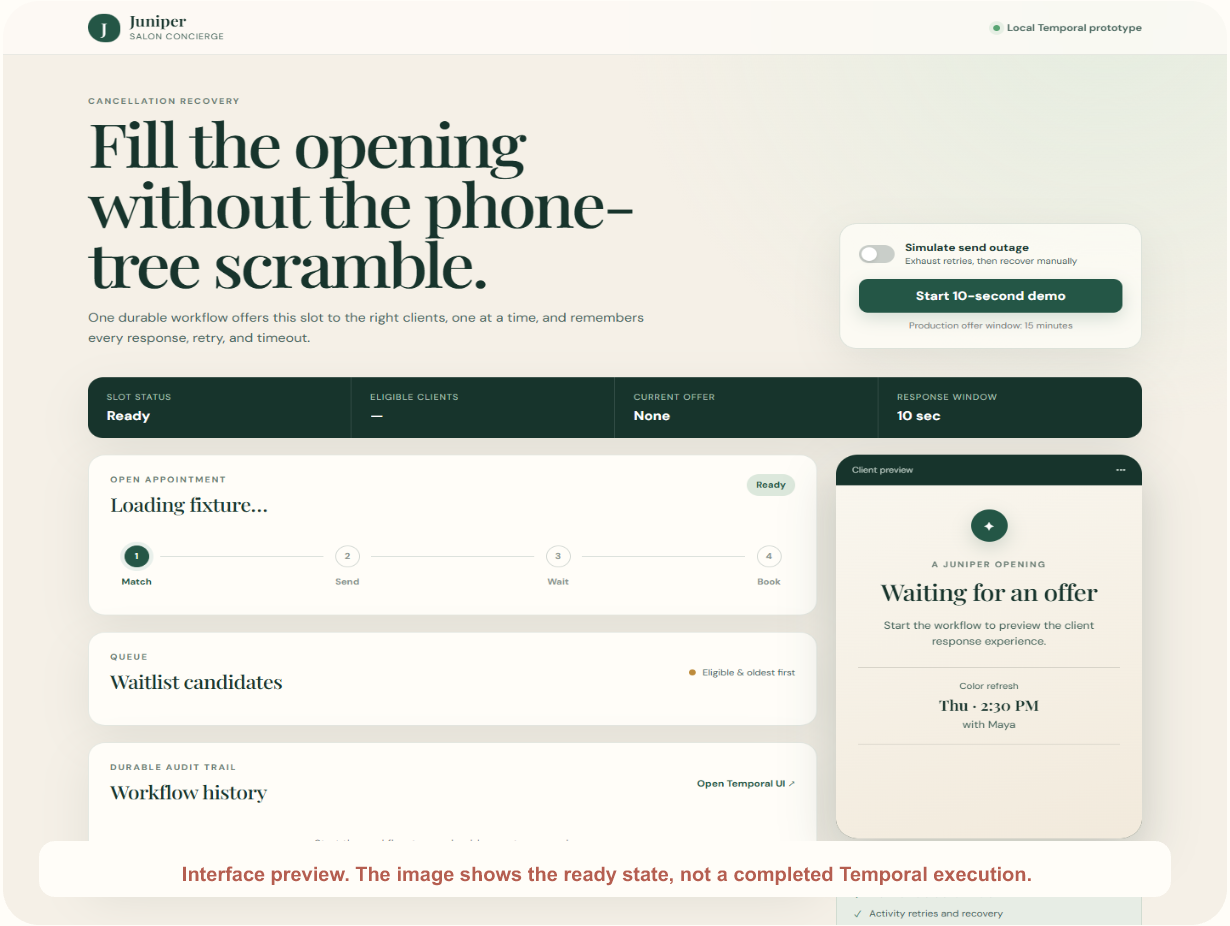

Contact the oldest eligible client and keep only one offer active.

03 **Wait**

Record accept or decline. A durable timer advances after the response window.

04 **Book or continue**

Book once on acceptance. Otherwise move to the next eligible client.

Interface preview. The image shows the ready state, not a completed Temporal execution.

TEMPORAL BUSINESS VALUE

Durable orchestration addresses the failure points in the current process

TEMPORAL CAPABILITY	BUSINESS EFFECT
Workflow state and history	Preserves the current client, prior responses, and recovery point.
Durable response timer	Moves outreach forward when a client does not answer in time.
Activity retries and operator recovery	Retries transient send failures and gives staff a visible recovery path.
Stable IDs and idempotency controls	Limits duplicate starts and repeated commands. Production booking still needs durable external storage.

Evidence boundary All nine tests passed: four offline checks plus five Temporal Workflow scenarios using the official time-skipping test server.

Verified locally: TypeScript, browser syntax, 4 offline tests, and 5 Temporal Workflow tests

SCOPE AND NEXT STEP

The prototype tests the orchestration concept, not production readiness

IMPLEMENTED IN SOURCE

01 Eligibility and oldest-first ordering

02 One active offer and response deadline

03 Accept, decline, skip, and recovery paths

04 Staff status Query and durable history design

SIMULATED OR EXCLUDED

01 SMS delivery, calendar booking, and waitlist data

02 Authentication, authorization, and persistent app storage

03 Production scale, privacy, high availability, and deployment

04 Measured improvement in fill time or staff effort

Proposed next step

Choose the first live boundary and run a measured pilot

Confirm SMS or booking first, record a baseline for time to fill and staff touches, then exercise success, timeout, recovery, and late-reply scenarios.
